FixIt: Getting Started

How to get the project on your computer, open it and start working.

1. Before you start

1. Install **Android Studio**: developer.android.com/studio
2. **Accept the GitHub invitation** (check your email, or open github.com/2005kairi/FixIt/invitations). Without accepting you can read the repo but not push.
3. Install **Git** if you do not have it: git-scm.com/downloads

2. Clone the project

Option A: in Android Studio (easiest)

1. Open Android Studio and choose Get from VCS (or File > New > Project from Version Control).
2. URL: `https://github.com/2005kairi/FixIt.git`
3. Pick a folder and click Clone. Sign in to GitHub if it asks.

Option B: in a terminal

```
git clone https://github.com/2005kairi/FixIt.git
```

Then in Android Studio choose Open and select the FixIt folder.

3. Open and build

1. Wait for Gradle sync to finish. The first time can take a few minutes.
2. If a message says the Gradle wrapper is missing, click the option to download or regenerate it. This is expected.
3. Create a phone to test on: Tools > Device Manager > Create Device. Pick any Pixel phone and a recent Android version.
4. Click the green Run button.

If the app complains about Java or Gradle versions, open File > Settings > Build Tools > Gradle and set the Gradle JDK to the bundled JDK.

4. Log in and try it

The app creates these accounts and eight sample requests the first time it starts with an empty database.

Role	Username	Password	Unit	Landlord
Landlord	`landlord1`	`landlord123`		
Landlord	`landlord2`	`landlord123`		
Tenant	`tenant1`	`tenant123`	A-101	landlord1
Tenant	`tenant2`	`tenant123`	A-102	landlord1
Tenant	`tenant3`	`tenant123`	B-201	landlord2

If you already ran an older version, clear the app's storage (long-press the app icon > App info > Storage > Clear storage) or uninstall it, so the new demo data is created.

Quick tour: log in as tenant1 and submit a request; log in as landlord1 and open it, mark it Done or Reject it with reasons; log back in as tenant1 to see the result.

5. Start working

Everyone works on the single main branch. Only edit the files you own.

Person	Screen	Files
1	Login	LoginActivity.java, activity_login.xml, User.java, UserDao.java
2	Sign Up	SignupActivity.java, activity_signup.xml, AppDatabase.java, build.gradle
3	Tenant Home	TenantHomeActivity.java, activity_tenant_home.xml, RequestAdapter.java, item_request.xml
4	New Request	NewRequestActivity.java, activity_new_request.xml, Request.java, RequestDao.java
5	Landlord Home	LandlordHomeActivity.java, activity_landlord_home.xml, NewRequestReceiver.java
6	Request Detail	RequestDetailActivity.java, activity_request_detail.xml, AndroidManifest.xml, testing

Java files are in `app/src/main/java/com/fixit/app/` and layouts in `app/src/main/res/layout/`.

6. Save and share your work

Run these in the Terminal at the bottom of Android Studio, or use the Git menu.

```
git pull --rebase          # get everyone's latest changes first
git add <your files>       # only the files you changed
git commit -m "Short description of what you did"
git pull --rebase          # again, in case someone pushed meanwhile
git push
```

- Pull before you start each day and before every push.
- Commit small and push often.
- If git pull --rebase reports a conflict, you most likely edited someone else’s file. Ask the owner before fixing it.
- Do not commit the build folder or local.properties. They are already ignored.

7. More documentation

- PROJECT_DOCUMENTATION: screens, features, data model, architecture, rules and the test plan.
- PERSON1_LOGIN_WORK: the Login screen with its full source.
- CHECKLISTS_ALL_STUDENTS: one checklist page per team member.
